

Fixed-dose ivermectin: innovating a 50 year-old drug

A two-sizes-fit-all treatment

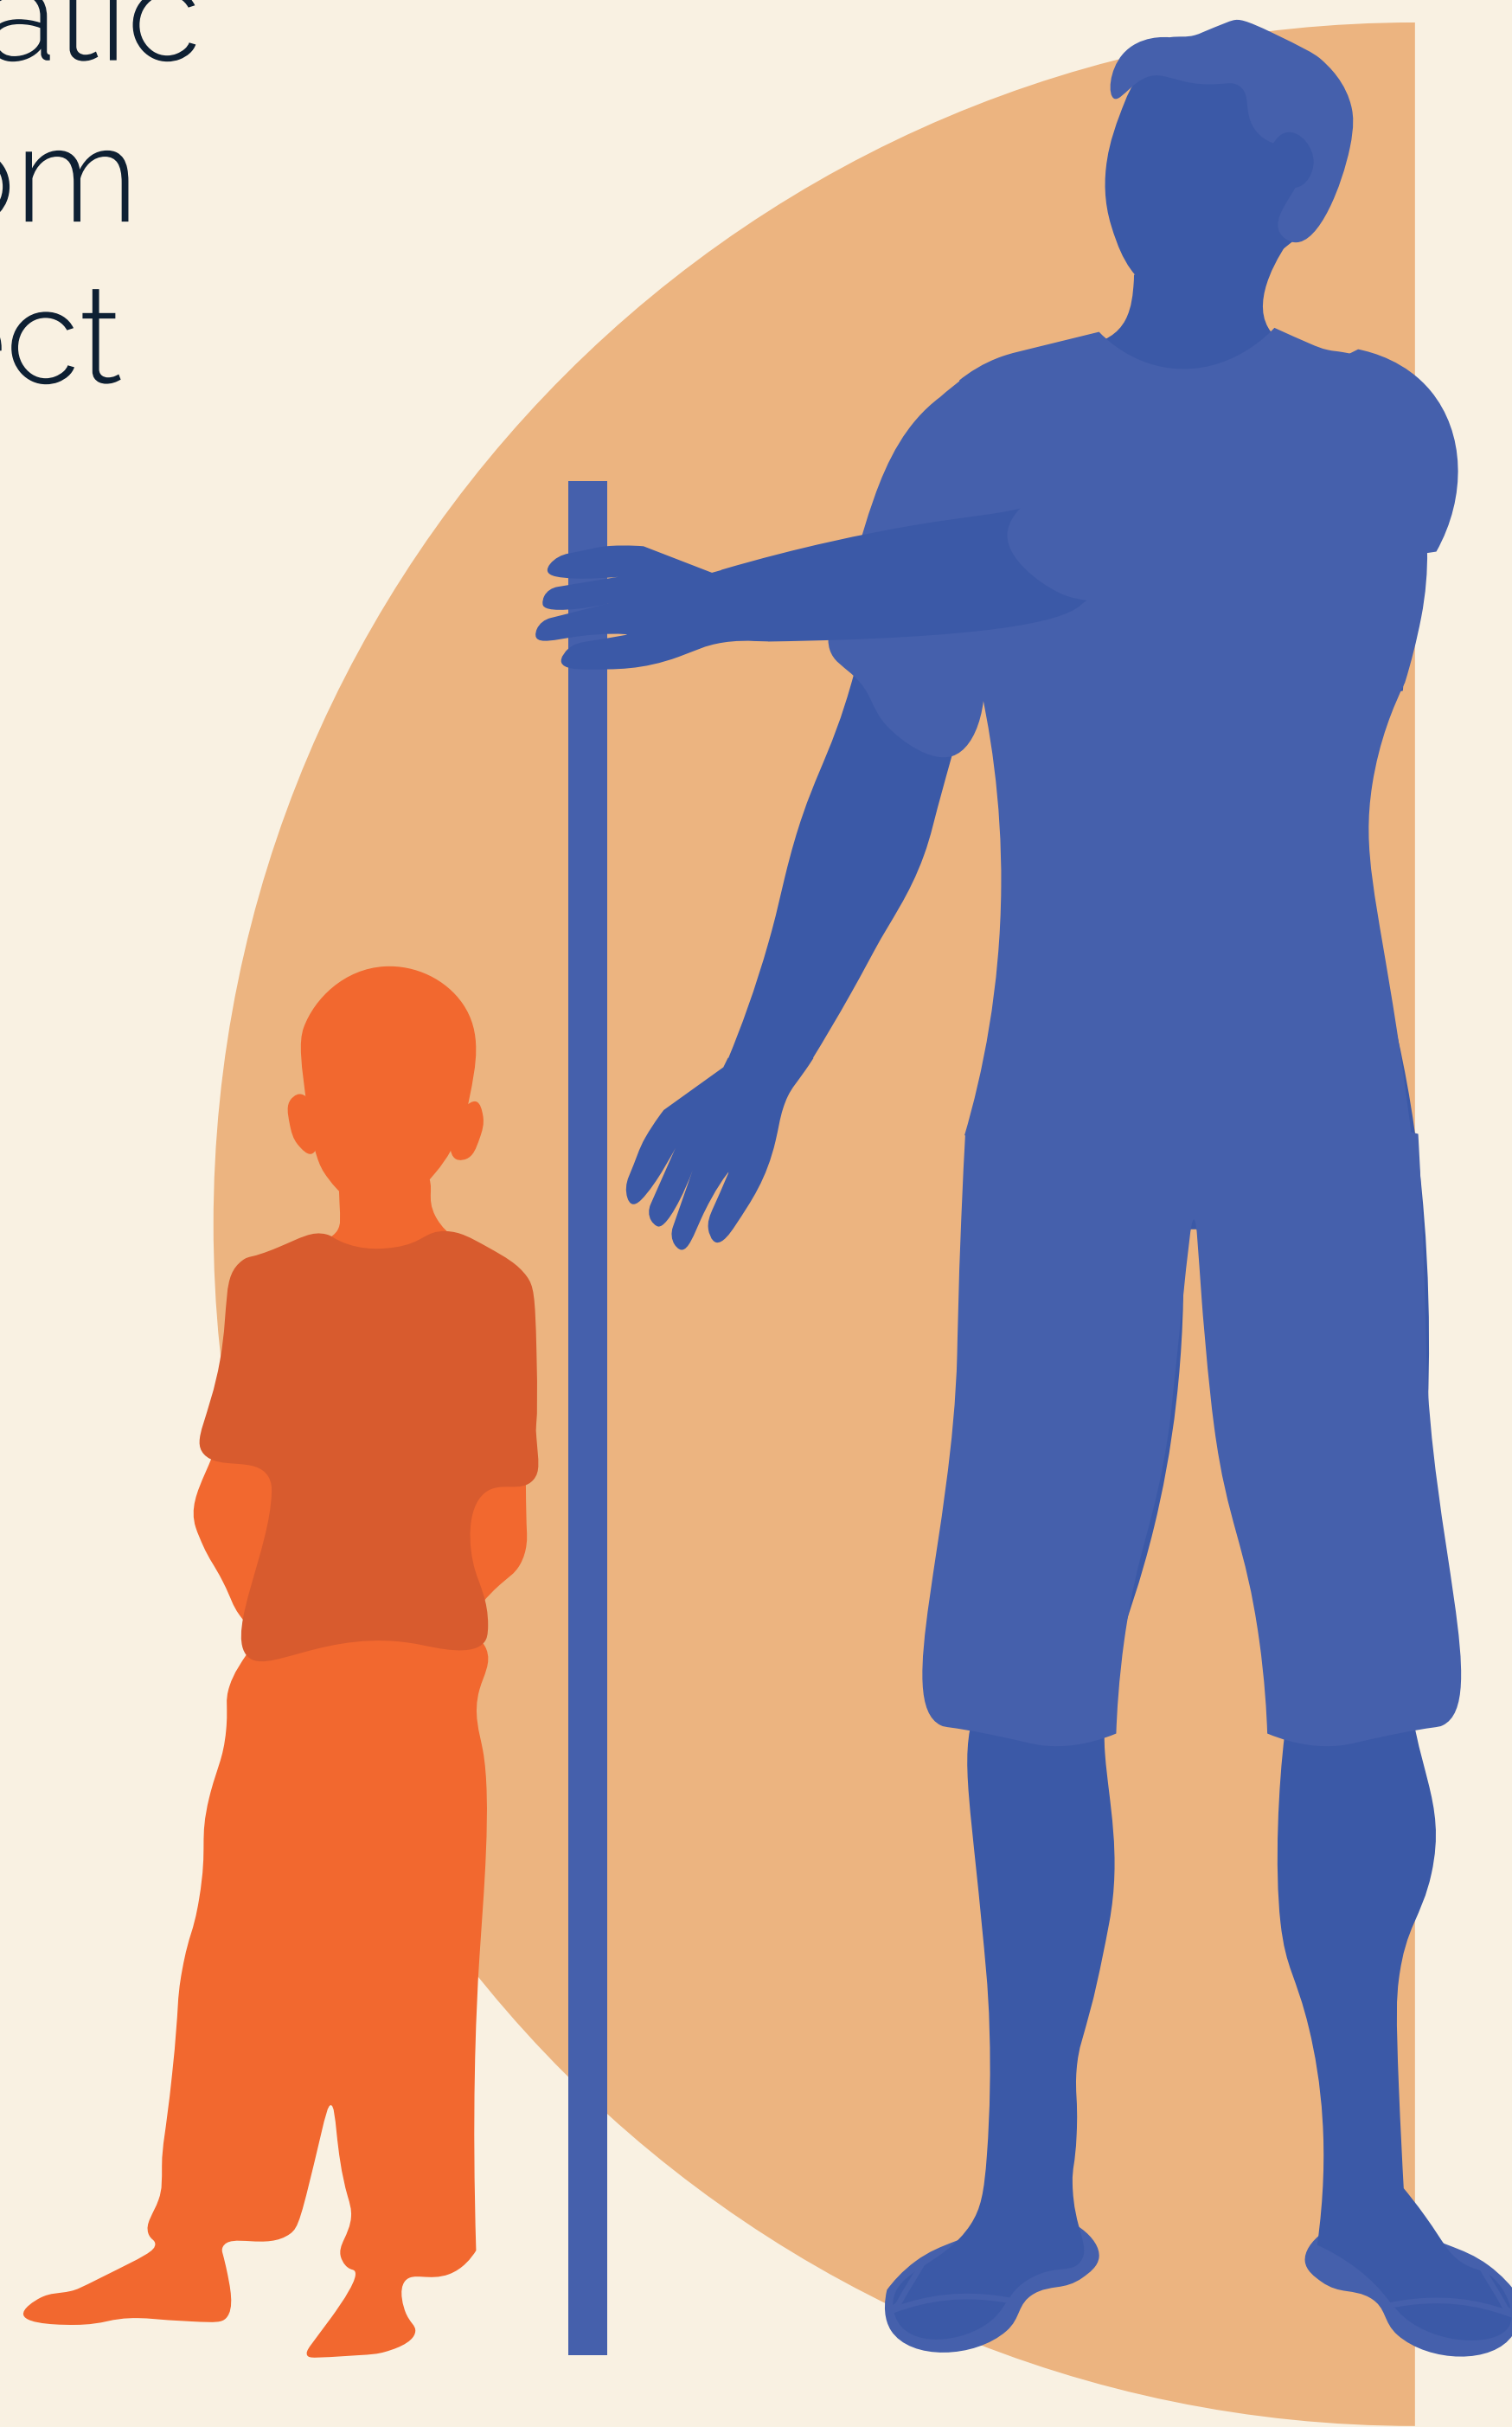

For the control of different Neglected Tropical Diseases

The current dosing strategy, based on height or weight, is prone to **underdosing**. At the same time, several studies have shown ivermectin to remain **safe at much higher doses** than those targeted by current recommendations.

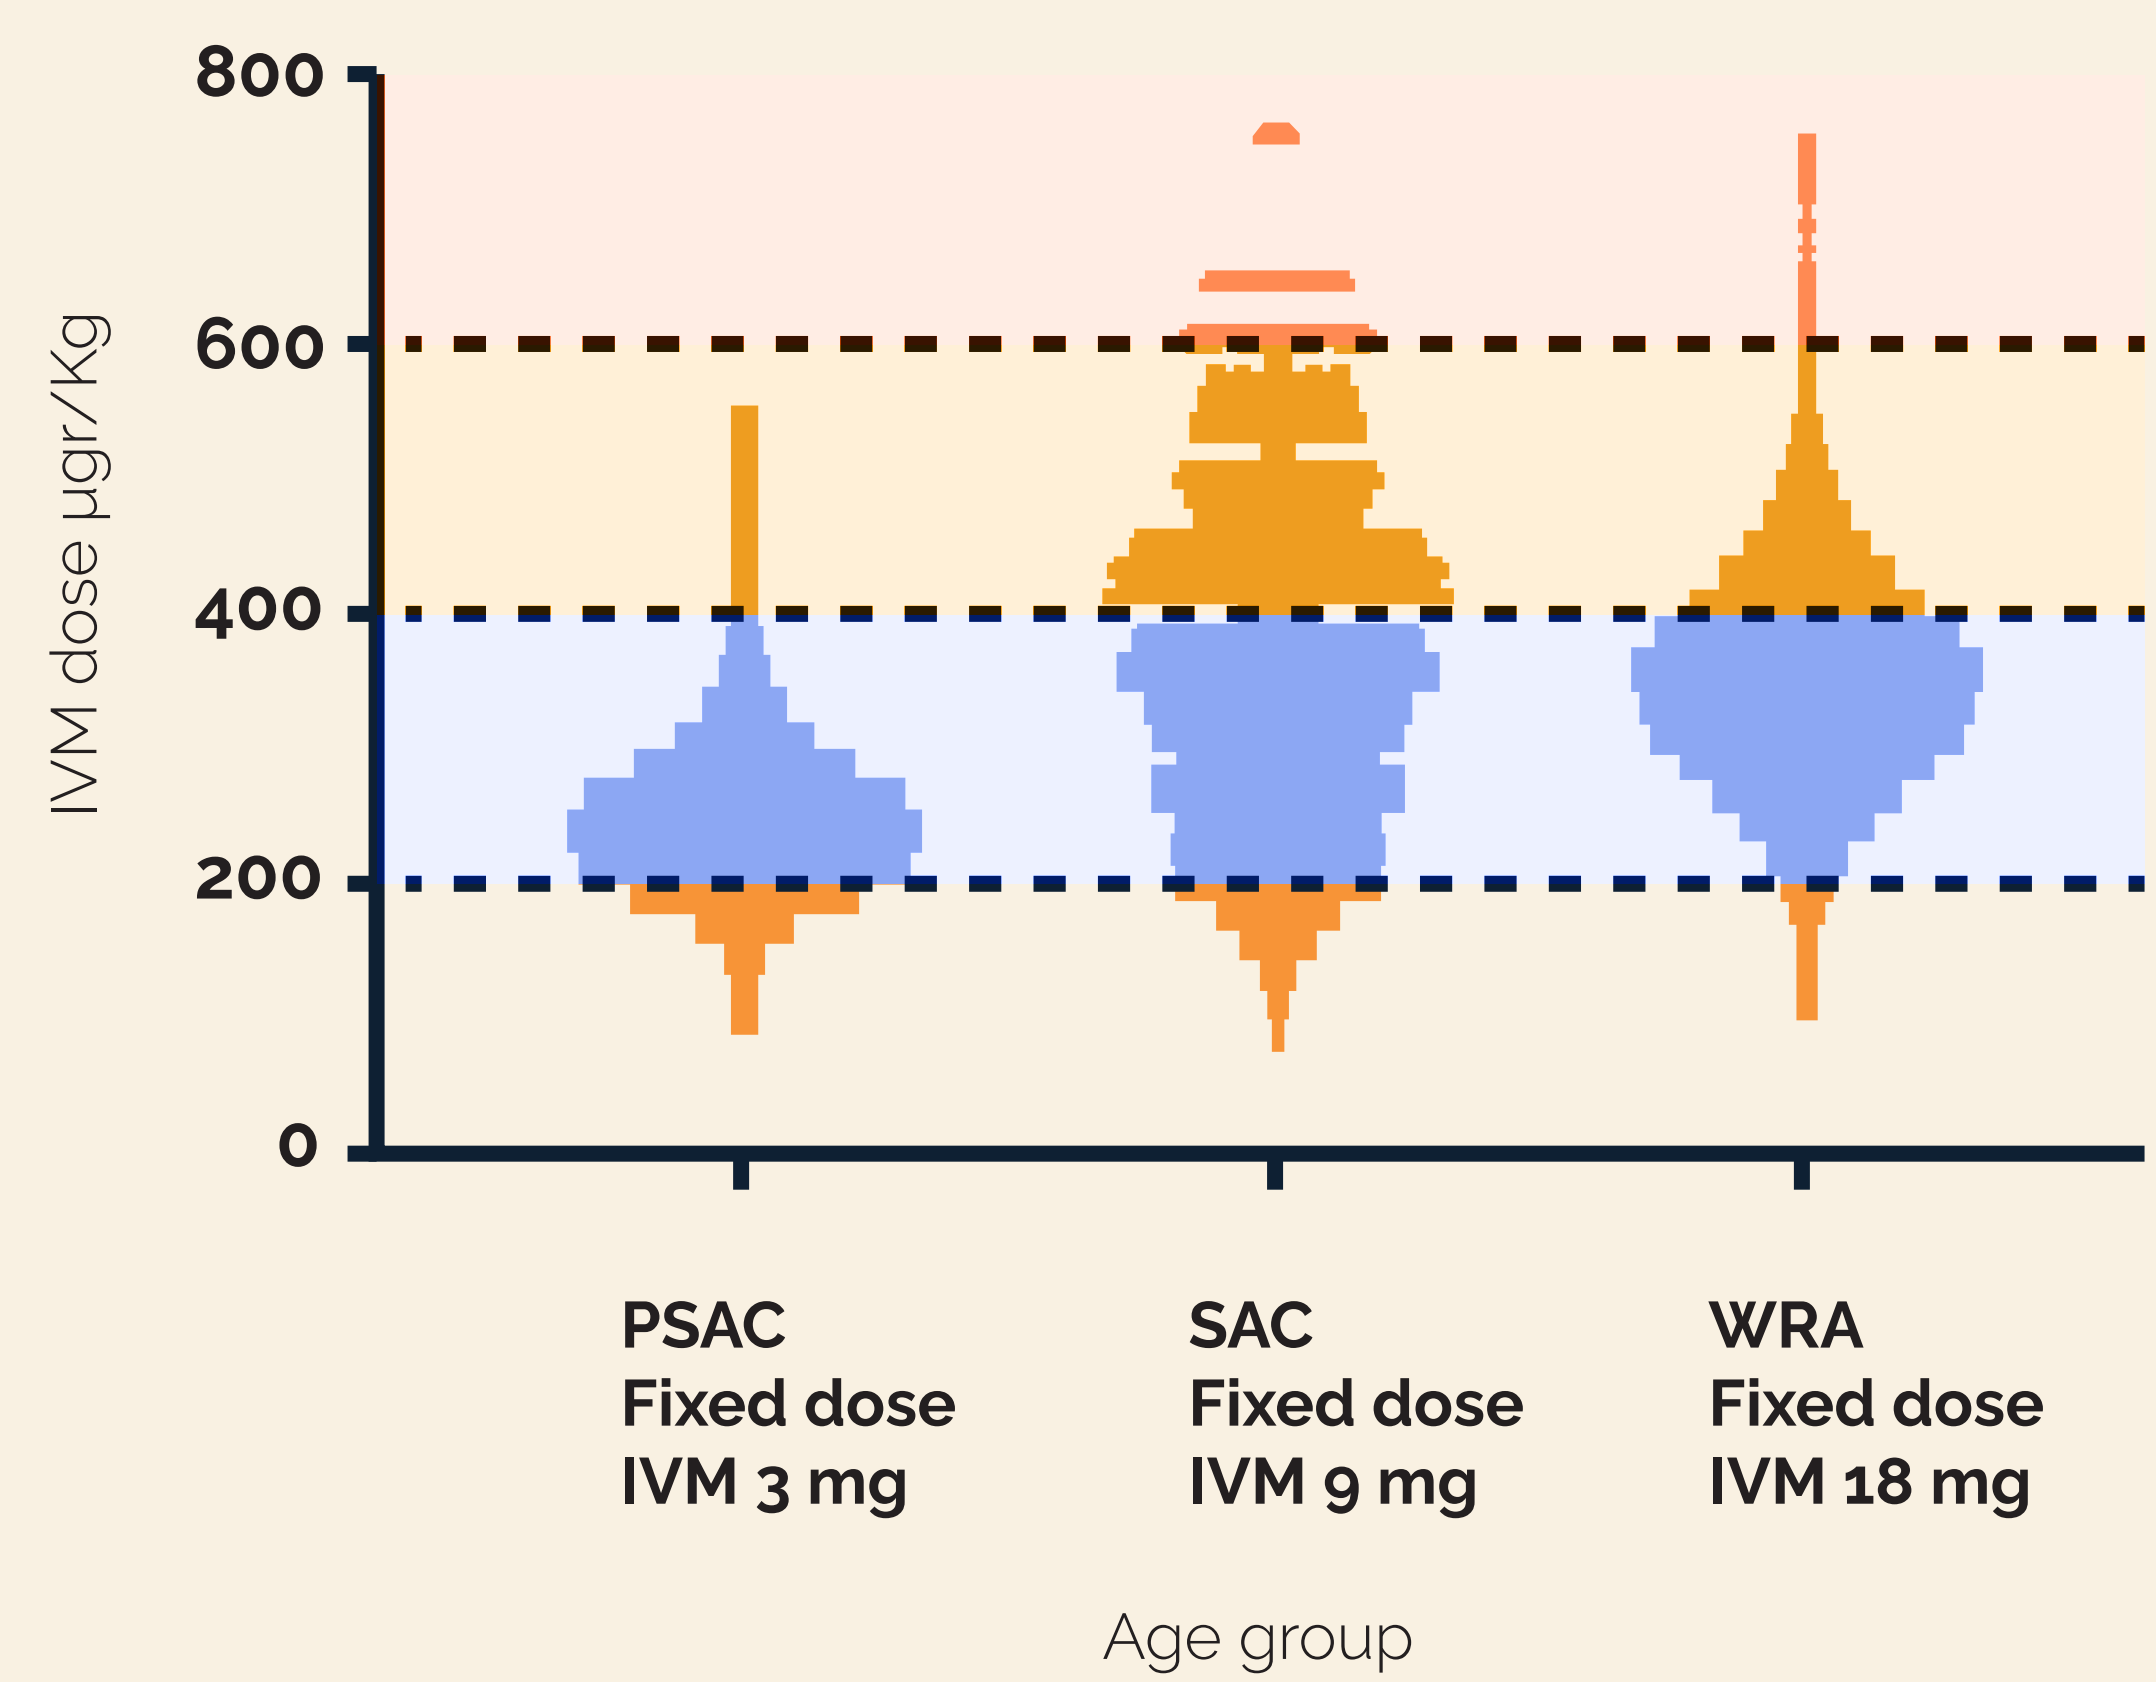

A promising strategy

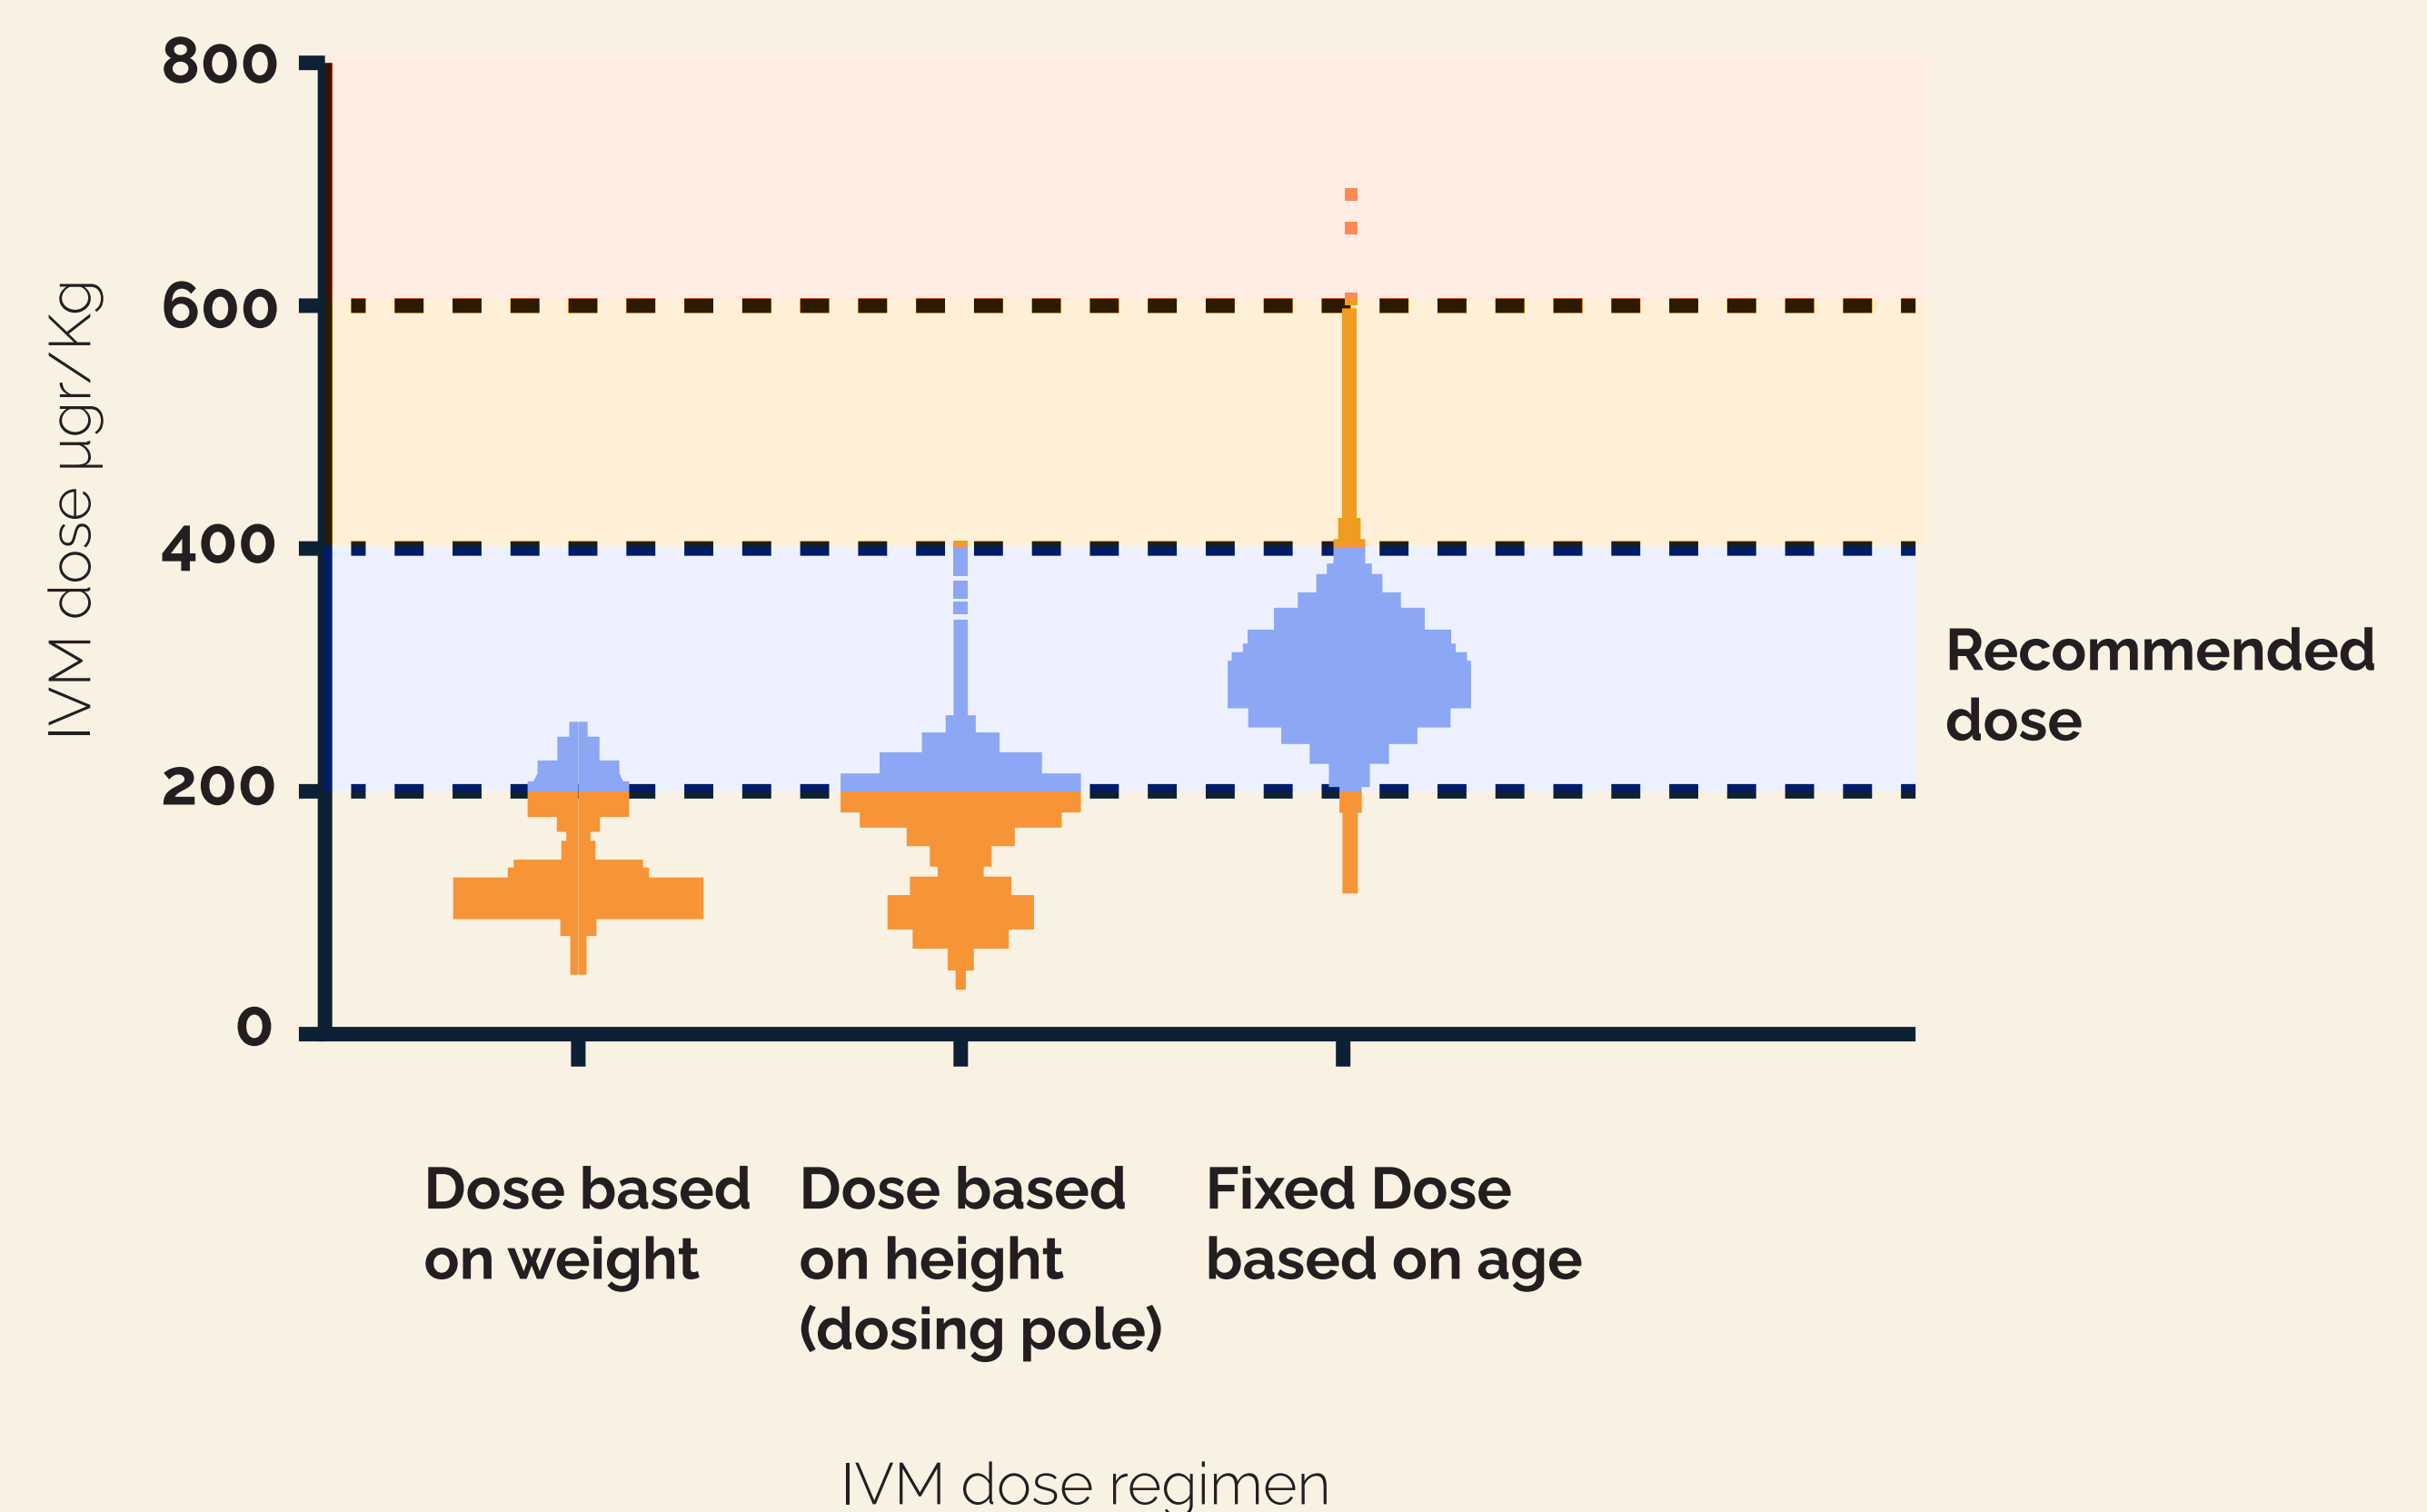

Based on a systematic review with data from over 700,000 subject

Adjusts to the recommended dose in all age groups

Helps avoid underdosing compared to current methods
